KEY TAKEAWAYS

Top 5 products contribute **39.83%** of total revenue, highlighting a strong concentration in key revenue drivers.

Health Beauty category contributes **9.59%** of total revenue, showing a significant share in overall performance.

Bottom performing products (e.g., flowers, home_comfort, electronics) have the lowest revenue contribution.

3K orders not delivered, with an undelivered rate of **0.04%**, indicating minimal delivery challenges.

Overall, strong order volume (**81,942**) and revenue (**1,04,49,347.65**) reflect healthy business performance and customer demand.

What the dashboard tells in one glance

- Revenue is already summarized by month, product category, customer state, and product performance.
- The dashboard combines sales KPIs, customer analytics, and business insights instead of showing only charts.
- Customer retention is low, so repeat-customer analysis is a strong business talking point.
- Delivery performance and low-rated products show where operational improvement can be made.

Business insights already visible in the PDF

- Health Beauty is one of the strongest revenue categories.
- Top 5 products contribute a major share of revenue, which supports a focused growth strategy.
- Repeat customers are only a small part of the base, so retention campaigns are important.
- States at risk and not-delivered orders help identify operational pain points.

Why this looks stronger now

- The PDF is no longer only visual - it also shows the logic behind the visuals.
- A dedicated DAX appendix proves that the KPIs are calculated, not manually typed.
- The project reads like a complete analytics case study.

What to say in the interview

- I built a Power BI sales dashboard for Olist using Power Query, data modeling, and DAX.
- I tracked revenue, customer behavior, delivery issues, and product performance.
- I organized all measures in a dedicated measures table for cleaner modeling.

DAX Measures Appendix - Part 1

Revenue and customer logic used across the dashboard

Revenue KPIs

Total Revenue

```
Total Revenue =  
SUM(olist_order_items_dataset[price])
```

Average Order Value

```
Average Order Value =  
DIVIDE([Total Revenue], [Total Orders])
```

Average Revenue per Product

```
Average Revenue per Product =  
DIVIDE([Total Revenue], DISTINCTCOUNT(olist_order_items_dataset[product_id]))
```

Health Beauty Revenue

```
Health Beauty Revenue =  
CALCULATE([Total Revenue],  
olist_order_items_dataset[Product_name(Eng)] = "health_beauty")
```

Customer and delivery KPIs

Total Customers

```
Total Customers =  
DISTINCTCOUNT(olist_customers_dataset[customer_unique_id])
```

Repeat Customers

```
Repeat Customers =  
COUNTROWS(  
FILTER(  
VALUES(olist_customers_dataset[customer_unique_id]),  
CALCULATE(DISTINCTCOUNT(olist_orders_dataset[order_id])) > 1  
)  
)
```

New Customers

```
New Customers =  
[Total Customers] - [Repeat Customers]
```

Not Delivered Orders

```
Not Delivered Orders =  
CALCULATE(  
DISTINCTCOUNT('olist_orders_dataset'[order_id]),  
'olist_orders_dataset'[order_status] <> "delivered"  
)
```

Not Delivered Rate %

```
Not Delivered Rate % =  
DIVIDE([Not Delivered Orders], [Total Orders])
```

Note: These measures power the KPI cards and the month/category/customer visuals on the dashboard.

Keeping the formulas in a separate appendix improves readability and makes the PDF feel like a true case study.

DAX Measures Appendix - Part 2

Product quality, ranking, and operational logic

PAGE 7 - DAX MEASURES

Product analytics

Total Orders

```
Total Orders =  
DISTINCTCOUNT(olist_order_items_dataset[order_id])
```

Average Rating

```
Average Rating =  
AVERAGE(olist_order_reviews_dataset[review_score])
```

Total Categories

```
Total Categories =  
DISTINCTCOUNT(olist_products_dataset[product_category_name])
```

Top Selling Product

```
Top Selling Product =  
VAR T =  
TOPN(  
1,  
SUMMARIZE(  
olist_order_items,  
olist_order_items[Product_name(Eng)],  
"Qty", COUNTROWS(olist_order_items)  
),  
[Qty], DESC  
)  
RETURN  
MAXX(T, olist_order_items[Product_name(Eng)]) & " (" & MAXX(T, [Qty]) & ")"
```

Operations and ranking

Low Rated Products

```
Low Rated Products =  
COUNTROWS(  
FILTER(  
ADDCOLUMNS(  
VALUES('olist_order_items_dataset'[Product_name(Eng)]),  
"AvgRating", CALCULATE([Average Rating])  
),  
[AvgRating] < 3  
)  
)
```

States at Risk

```
States at Risk =  
COUNTROWS(  
FILTER(  
ADDCOLUMNS(  
VALUES('olist_customers_dataset'[customer_state]),  
"NDRate", CALCULATE([Not Delivered Rate %])  
),  
[NDRate] > 0.2  
)  
)
```

Top 3 Products

```
Top 3 Products =  
VAR T =  
TOPN(  
3,  
ADDCOLUMNS(  
VALUES(olist_order_items_dataset[Product_name(Eng)]),  
"Rev", CALCULATE([Total Revenue])  
),  
[Rev], DESC,  
olist_order_items_dataset[Product_name(Eng)], ASC  
)  
RETURN  
CONCATENATEX(T, [Product_name(Eng)], ", ", [Rev], DESC)
```

Interview-ready notes All metrics are calculated through DAX measures and can be explained by business use-case: revenue, retention, delivery, and product quality.

Best practice: keep these measures in a dedicated Measures table, then connect all visuals to those measures.
